

Market-Gap Numbers in SAR

The riyal figures behind the Innovation (#1) and Feasibility (#5) slides — sourced to SAMA / FSDP / IMF / GASTAT / World Bank, adversarially verified.

Run wf_f6d4674f-56d · 104 agents · 22 confirmed / 3 refuted · Freeze day 2026-07-15

Run: wf_f6d4674f-56d · 104 agents · 5 phases (Scope → Search → Fetch → Verify → Synthesize)
Volume: 5 search angles · 22 sources fetched · 73 claims extracted · top 25 adversarially verified (3 independent judges each) · **22 confirmed** · **3 refuted** · **0 unverified** **Purpose:** the riyal figures **EVIDENCE.md** deliberately did NOT have — quantify the market gap in **SAR** to back the **Innovation (#1)** and **Feasibility (#5)** slides, sourced to SAMA / FSDP / IMF / GASTAT / World Bank so a Saudi banking judge can't knock them down. **Sourcing bar (founder decision, Jul 15):** computed-from-primary is allowed — but the arithmetic goes ON the slide, every input labelled with source + vintage. Companion to **EVIDENCE.md** .
Freeze note: produced on freeze day. This is a *record*; fold the winning numbers into **EVIDENCE.md** / **JUDGE_SCRIPT.md** deliberately, don't bulk-paste.

HONESTY LABELS (same as EVIDENCE.md)

Label	Meaning
[P]	PRIMARY-VERIFIED — fetched from the body that owns the fact (SAMA, FSDP, IMF, GASTAT, World Bank)
[P→C]	COMPUTED-FROM-PRIMARY — arithmetic on primary inputs; show the math on the slide
[S]	SECONDARY — SAMA-attributed but via Arab News / Argam; upgrade to the SAMA table before stage
[ILL]	ILLUSTRATIVE — a scenario built on an assumption (reduction %, realization %); never say "measured"
[X]	REFUTED — do not say. Listed at the bottom.

SAR 338 billion

the SME financing gap Saudi Arabia has *officially committed* to close

Why this one wins: it is the only "gap" number backed by the **government's own published target**. The FSDP (Vision 2030's Financial Sector Development Program) sets SME lending at **20% of bank credit by 2030**; the actual at Q4 2024 is **9.4%**. That 10.6-point gap, applied to SAMA's Q2-2025 total bank credit, is **SAR 338bn**. A Saudi banking judge cannot dismiss the Kingdom's own KPI. **[P→C]**

The math (goes on the slide):

20.0% × SAR 3,186.3bn = SAR 637.3bn (Vision 2030 target)

9.4% × SAR 3,186.3bn = SAR 299.5bn (today, Q4 2024)

gap = 10.6 points = SAR 337.8bn ≈ SAR 338bn

Inputs: FSDP Annual Report 2024 (9.4% actual, 20% target) **[P]** · SAMA Key Economic Developments Q2 2025, total bank credit SAR 3,186.3bn **[P]**.

Pair it with the addressable TAM so the slide has a gap *and* a pool:

"Saudi banks hold **SAR 3.19 trillion** of credit, including **SAR 470 billion** of consumer finance — that's the pool Tabaqa plugs into. The Kingdom has committed to move SME lending from 9.4% to 20% — **SAR 338 billion** it must unlock, and thin-file underwriting is the bottleneck."

Judge counter → rebuttal: "You're mixing a Q4-2024 ratio with a Q2-2025 base." → "Flagged — but the gap is 10.6 points regardless of vintage; on any 2024–25 credit base it's SAR 300–340bn, and Tabaqa attacks the thin-file scoring gap directly."

THE FOUR ANGLES

ANGLE 4 — Market size / TAM · opportunity sizing · confidence: HIGH [P]

The pool the engine touches, all Q2 2025 unless noted:

Figure	SAR	Source	Label
Total Saudi bank credit (outer pool)	3,186.3 bn	SAMA Key Economic Developments Q2 2025 (+15.8% YoY)	[P]
Consumer / personal finance (directly addressable)	469.8 bn	SAMA Q2 2025 (14.7% of credit) — <i>excludes mortgages & cards</i>	[P]
Banking-sector assets	4,494 bn	FSDP Annual Report 2024 (end-2024)	[P]
Retail / residential mortgages	698.8 bn	SAMA via Arab News (Q1 2025)	[S]
Total real-estate loans	922.2 bn	SAMA via Arab News (Q1 2025)	[S]
Auto / vehicle finance (finance-company channel)	25.16 bn	SAMA via Arab News (2024, +18.8% YoY, 26% of finance-co credit)	[S]
MSME lending outstanding	351.7 bn	SAMA (2024)	[S]

Vehicle-demo stage sentence (your SAR 150k auto demo sits inside this): "*Vehicle finance through Saudi finance companies alone is SAR 25 billion, growing 19% a year — our SAR 150,000 auto decision sits inside exactly this fast-growing, document-heavy flow.*"

⚠ SAMA doesn't publish a clean *bank-only* auto line, so SAR 25bn is the non-bank channel only — a conservative floor. Upgrade the [S] rows to [P] by pulling SAMA's "Annual Performance of Finance Companies" + Monthly Statistical Bulletin tables before the deck ships.

ANGLE 1 — Foregone lending to the unscorable · serves Innovation #1 · confidence: MEDIUM
[P→C]

~6 million banked-but-unscorable adults → SAR 55–184 bn of consumer credit locked out

The wedge (goes on the slide):

78.84%	banked	(World Bank Findex, 2024 field data)
56.7%	bureau-covered	(World Bank Doing Business 2020)

22.14 points × ~27.4M adults (15+, GASTAT 2024) = ~6.07M people

Addressable credit:

consumer-credit intensity	= SAR 469.8bn ÷ 15.53M scorable adults = ~SAR 30,250/adult
full parity	= 6.07M × 30,250 = ~SAR 184bn
conservative	= 30% realization = ~SAR 55bn

Stage sentence: "Saudi Arabia banks 79% of adults but only 57% are visible to a credit bureau — that 22-point gap is roughly **6 million banked, invisible-to-scoring adults**, and even at conservative parity it's **SAR 55–180 billion** of consumer credit they can't access today."

Judge counter → rebuttal: "You're mixing 2024 banking data with 2020 bureau coverage." → "Flagged — it's the newest published bureau-coverage figure; the wedge is directionally robust, and Tabaqa scores from consented cash-flow data precisely so bureau lag stops being the gate."

⚠ **RECONCILE BEFORE STAGE:** your prior materials say **~11M unscorable**; this rigorous GASTAT adult (15+) base gives **~6M**. They use different denominators. Pick one story and make every doc agree, or a judge will catch the internal inconsistency. The ~6M is the more defensible (it's adults, not total population). The SAR figure is [P→C] with assumptions (realization %, credit-parity) — say "illustrative."

ANGLE 3 — Avoidable bad-loan losses · serves Data / ROI · confidence: MEDIUM (stock [P→C], reduction [ILL])

~SAR 40 bn NPL stock → SAR 4–12 bn/yr illustrative reducible losses

NPL stock (primary):

1.5% NPL ratio (SAMA FSR 2024, for 2023; provision coverage 151%)

× SAR 2,584bn loan book (SAMA, end-2023) = SAR 38.8bn ≈ SAR 40bn

cross-check: 1.5% × IMF-implied SAR 2,670bn (66.7% of GDP) = SAR 40bn ✓

Reducible (ILLUSTRATIVE — cash-flow underwriting cuts roll rates ~30%, Petal/Plaid):

10% × 40bn = ~SAR 4bn | 20% = ~SAR 8bn | 30% = ~SAR 12bn

Stage sentence: "Saudi banks carry roughly **SAR 40 billion** of non-performing loans; independent evidence shows cash-flow underwriting cuts roll rates ~30% — even a conservative 10–20% improvement is **SAR 4–8 billion** of avoidable losses a year."

Judge counter → rebuttal: "NPLs are already low at 1.5% — where's the upside?" → "Exactly why the marginal, thin-file applicant is where losses concentrate — better underwriting reduces NEW defaults among borrowers banks currently reject or misprice, not the existing stock. It's a forward-flow number, labelled illustrative."

⚠ Vintage-match: apply the 2023 ratio to the 2023 loan book (SAR 40bn). Cite IMF **Table 5** (not "Table 7"). Ties directly to your own **+0.117 AUC** lift → **–61% bad rate** already in the deck.

ANGLE 2 — Bank operational waste · serves Feasibility #5 · confidence: LOW (benchmark [P], KSA application unsourced)

Personnel = 67% of loan-production cost · automation cuts cost-per-loan 14% (measured) to 40% (aspirational)

This is the weakest angle for a hard SAR figure — no Saudi cost-to-originate exists. The only real anchor is the **Freddie Mac 2024 Cost to Originate Study** (US single-family mortgage) [P]: personnel expenses are 67% of total production cost, underwriting "remains fairly manual and therefore costly," high-automation lenders originate loans "\$1,500, or 14%, less costly," and executives "believe it can help them save up to 40%."

Stage sentence: "Two-thirds of loan-origination cost is people doing manual document and underwriting work; lenders who automate cut cost-per-loan **14% measured**, up to 40% believed — *Tabaqa delivers that straight-through, in seconds.*"

Judge counter → rebuttal: "That's US mortgage data, not Saudi auto finance." → "Correct — I present it as a global efficiency benchmark, not a Saudi figure; the mechanism (manual underwriting + document verification IS the cost) is channel-agnostic, and I quote the measured 14%, not the 40% aspiration."

⚠ **Do NOT fabricate a Saudi SAR operational-savings number** — it needs two unsourced inputs (loans/yr, cost/loan). If you must show one, label it fully assumption-driven. **Better Feasibility play:** lean on the evidence you already have — **EVIDENCE.md** Tier 6 (Discovery Bank live 7 yrs, 1.2M customers; 21M US telematics policyholders) proves "this already ships in a regulated bank," which is what قابلية التنفيذ actually asks. The 14% Freddie Mac number is the efficiency supplement, not the load-bearing claim.

HOW THE ANGLES MAP TO THE TWO CRITERIA YOU ASKED FOR

- **Innovation (#1)** — lead with the **SAR 338bn SME gap** (the market is real and government-sized) + ~6M unscorable / **SAR 55–184bn** (the specific white space Tabaqa attacks that nobody else does).
- **Feasibility (#5)** — the honest riyal number here is weak, so carry Feasibility on **Tier 6 "already live"** (Discovery, telematics) + the **14% Freddie Mac** efficiency benchmark + your shipped product & SAMA legal chain (**EVIDENCE.md** Tier 5). The **SAR 40bn NPL / SAR 4–12bn reducible** ROI number doubles as feasibility proof that the bank *makes money* deploying this.

🚫 REFUTED — DO NOT SAY (killed in verification)

1. **"SAR 932.8bn / 29.3% real estate, Q2-2025"** — REFUTED 1-2. Use the confirmed **SAR 922.2bn (Q1-2025)** instead.

- 2. **"MSME SAR 258bn end-2023 / SME gap SAR 259bn"** — REFUTED 0-3. Use **MSME SAR 351.7bn (2024)** and the **10.6pp** → **SAR 338bn** gap instead.
- 3. **"IMF: household DSTI ~40% / data scarce"** — REFUTED 0-3. Do not cite.
- 4. **"SAR 1.4 trillion retail/personal-finance market"** (the old Ken Research → WordPress figure) — stays dead. Its primary replacement is SAMA **SAR 2,584bn (2023) / SAR 3,186bn (Q2-2025)** total credit.

HONEST GAPS (what we could NOT source — know these before stage)

- 1. **Unscorable headcount: ~6M (rigorous) vs ~11M (prior team materials)** — reconcile the base or the deck contradicts itself.
- 2. **No primary Saudi cost-to-originate / application-abandonment / time-to-decision** — Angle 2's SAR figure can't be built from Saudi inputs. Biggest gap.
- 3. **SAMA publishes no consumer-finance borrower count and no clean bank-only auto line** — average-ticket and bank auto TAM are derived, not primary.
- 4. **NPL vintage is 2023** — ~2 years old for a Jul-2026 pitch. Check for SAMA FSR 2025 / IMF Article IV 2025 (CR 25/223) to refresh to a 2024 loan book.

SOURCE LEDGER (primaries)

Source	Quality	Used for
SAMA — Key Economic Developments Q2 2025	primary	Total credit 3,186.3bn; consumer 469.8bn
FSDP Annual Report 2024 (Vision 2030)	primary	SME 9.4%→20%; assets 4,494bn
SAMA — Financial Stability Report 2024	primary	NPL 1.5%; credit 2,584bn (2023)
IMF Article IV / FSSA 2024 — CR 24/281	primary	NPL series; loans 66.7% of GDP (Table 5)
GASTAT — Population Estimates 2024	primary	Adult (15+) base ~27.4M
World Bank — Global Findex (2025 title, 2024 field)	primary	78.84% banked
World Bank — Doing Business, Saudi Arabia	primary	56.7% bureau coverage
Freddie Mac — 2024 Cost to Originate Study	primary (US)	67% personnel; 14%/40% savings
Arab News — SAMA finance-company / auto · real estate · SME	secondary	Segment figures (upgrade to SAMA tables)

 **Fetch caveat:** several SAMA/FSDP/IMF/Freddie Mac PDFs returned 403/404 to automated fetch; figures were confirmed via search-indexed verbatim text + independent corroboration (SPA, Argaam, Zawya, Arab News). **Re-open every primary link and confirm the number live before the deck ships.**

Created 2026-07-15 from a 104-agent adversarially-verified research pass (`wf_f6d4674f-56d`). Extends `EVIDENCE.md` ; does not re-verify what's already there.
